PhD Degrees in Biology & Biomedical Sciences

Each program has its own steering committee, which provides students with guidance, addresses their needs, and monitors their progress. The committee also helps each student customize the course of study to match their individual needs. Each of the 12 programs establishes its own degree requirements.

Across all of the programs, the course of study consists of six distinct parts:

Courses
This generally requires two to five semesters and usually consists of four to nine courses in areas fundamental to the student’s program. Students are expected to maintain a B average in graduate courses.

Laboratory Rotations
Selecting a thesis advisor is the most important decision a student makes in graduate school. To help each student make an informed, thoughtful choice, the Division builds in flexibility to explore options. Students usually participate in three lab rotations during their first year. Additional rotations can be arranged, and rotation lengths are flexible. Students usually begin their thesis research by the end of their first year.

Qualifying Examination
After required courses are completed, each student takes a preliminary or qualifying examination to assess their mastery of the field and their ability to integrate information across fields. Upon successful completion of the qualifying exam, the student concentrates on thesis research.

Mentored Teaching Experience
Students must complete at least one semester of a Mentored Teaching Experience (MTE). Prior to beginning their MTE, DBBS students will be required to complete the Graduate Student Teaching Orientation and a minimum of three 90-minute teaching workshops, each covering a different topic, offered by the Teaching Center. Students must also enroll in LGS 600 prior to their MTE. Individualized instruction and mentoring will be provided by the course director of the class to which the student has been assigned. The course director will provide feedback throughout the semester and will complete an evaluation of the student upon the completion of the MTE.

Thesis Research
Thesis research begins once the student has chosen a laboratory in which to work. With their mentor — the laboratory’s principal investigator — the student devises a thesis project and chooses an advisory committee. Typically between the end of their second year and the middle of their third year, students present their thesis proposals to the thesis committee. Upon successful approval of the thesis proposal, the student officially becomes a doctoral candidate. For the rest of the student’s program of study, the thesis committee monitors progress and meets at least once a year to provide analysis and advice. It also serves as the thesis defense committee when the thesis is ready for presentation. Most students complete and defend their dissertations by the end of their sixth year.

Scientific Scholarship
Keeping abreast of scientific developments is critical for faculty and students alike. The Division offers many ways to stay current. More than 15 weekly biology seminars provide excellent opportunities to meet outstanding scientists from outside Washington University. Several annual symposia bring internationally recognized speakers to campus. Journal clubs meet weekly for students, postdoctoral fellows and faculty to present and discuss current scientific literature. A number of Interdisciplinary Research Pathways (https://dbbs.wustl.edu/curricular/interdisciplinary-research-pathways/) allow students to enhance their PhD program. Program retreats allow for informal interaction among students and faculty. The Division also provides funds for each student for professional development.
